

Environment and Natural Resources Trust Fund

M.L. 2020 Approved Work Plan

General Information

ID Number: 2020-016

Staff Lead: Corrie Layfield

Date this document submitted to LCCMR: August 19, 2021

Project Title: Do Beavers Buffer Against Droughts And Floods?

Project Budget: \$168,000

Project Manager Information

Name: Steve Windels

Organization: National Park Service - Voyageurs National Park

Office Telephone: (218) 283-6692

Email: steve_windels@nps.gov

Web Address: <https://www.nps.gov/voya/index.htm>

Project Reporting

Date Work Plan Approved by LCCMR: August 20, 2021

Reporting Schedule: April 1 / October 1 of each year.

Project Completion: June 30, 2024

Final Report Due Date: August 14, 2024

Legal Information

Legal Citation: M.L. 2021, First Special Session, Chp. 6, Art. 5, Sec. 2, Subd. 03I

Appropriation Language: \$168,000 the second year is from the trust fund to the commissioner of natural resources for an agreement with Voyageurs National Park to analyze existing data sets to determine the role of beaver populations and beaver ponds in buffering the region against droughts and floods.

Appropriation End Date: June 30, 2024

Narrative

Project Summary: We propose to use existing data sets to link beaver population data to water storage in beaver ponds, to determine if they buffer against droughts and floods.

Describe the opportunity or problem your proposal seeks to address. Include any relevant background information.

Beavers are called “ecosystem engineers” because their dam-building activities create ponds that store large amounts of water and sediment, altering landscapes on a scale rivaled only by humans. Predicted climate change scenarios for Minnesota suggest changes in timing and amounts of rainfall will increase the frequency of both floods and droughts. Beaver ponds provide a natural solution to mitigate these effects because beaver ponds reduce the severity of flood events and store immense amounts of water during droughts. Due to this, beaver ponds will continue to be important habitat for fish and wildlife such as moose, swans, and brook trout as Minnesota’s landscape and climate changes, proving beavers are indeed “keystone species.”

Though techniques exist to calculate how much water beavers store in ponds, we still lack understanding of when and why beavers build their ponds where they do. That is, we don’t know how changes in beaver populations, at individual, colony, and population scales, affect where and when beavers build and maintain ponds. Increased knowledge in these areas will improve understanding of how changes in beaver abundance will result in changes in water storage, better informing how northern Minnesota will respond to future floods and droughts.

What is your proposed solution to the problem or opportunity discussed above? i.e. What are you seeking funding to do? You will be asked to expand on this in Activities and Milestones.

The Greater Voyageurs Ecosystem (GVE) surrounding Voyageurs National Park contains some of the highest densities of beavers in the USA, and long-term research on beavers conducted in the park has yielded unprecedented insights into beaver ecology for the benefit of natural resource managers and scientists in Minnesota and beyond. More than 65 peer-reviewed science publications have resulted from beaver-related research conducted at that park from the 1980s to the present. More importantly, park staff and collaborators have continued to collect a wealth of data from the GVE, in the process establishing one of the largest and longest running studies of beaver populations in the world. National Park Service Wildlife Biologist Dr. Steve Windels and others have successfully captured more than 1,300 individual beavers, digitized more than 7,000 beaver ponds and dams, mapped nearly 4,000 beaver lodges in the GVE, and captured more than 150,000 photographs of beavers using game cameras since 2004.

We propose to extract new and valuable additional information from this unprecedented dataset that can be used better understand how beavers affect water storage and availability, and this information will be used to improve science and management of Minnesota’s water resources.

What are the specific project outcomes as they relate to the public purpose of protection, conservation, preservation, and enhancement of the state’s natural resources?

The proposed research will provide answers to the following questions about how beavers affect water storage and availability in northern Minnesota:

Question 1: How much water storage exists in the Greater Voyageurs Ecosystem and has it changed through time?

Question 2: Why do beavers build dams and lodges where they do and how can understanding this assist management?

Question 3: How does death and dispersal of beavers affect creation of new dams or re-occupancy of old ones?

Project Location

What is the best scale for describing where your work will take place?

Region(s): NE

What is the best scale to describe the area impacted by your work?

Region(s): NE

When will the work impact occur?

During the Project and In the Future

Activities and Milestones

Activity 1: How much water storage exists in the Greater Voyageurs Ecosystem and has it changed through time?

Activity Budget: \$41,000

Activity Description:

Previous projects have digitized beaver ponds and dams on aerial photo sets spanning the period 1927-2013 within selected areas of the GVE. Additional work is planned for 2020 to include more recent photo sets. We will apply existing algorithms to convert pond dimensions (area, dam length, mean depth) to actual and potential water storage capacity to document changes over time and space, and how these relate to periods of flood and drought conditions. We will also link changes in water storage capacity to changes in beaver populations in the GVE.

Activity Milestones:

Description	Completion Date
Estimate water storage capacity for available years	June 30, 2023
Final report and peer-reviewed publication submitted	December 31, 2023

Activity 2: Determine factors affecting where beavers build dams and lodges to improvement management.

Activity Budget: \$51,000

Activity Description:

Where beavers decide to build dams and lodges has an influence on the size and shape of individual beaver ponds, and thus affects their water storage capacity. Using our existing database of >4,000 beaver lodges, we will build computer models to understand what factors best predict where beavers build their dams and lodges.

Activity Milestones:

Description	Completion Date
Analyze factors affecting where beavers build dams and lodges	December 31, 2023
Final report and peer-reviewed publication submitted	June 30, 2024

Activity 3: How does death and dispersal of beavers affect creation of new dams or re-occupancy of old ones?

Activity Budget: \$76,000

Activity Description:

We will use our existing data sets of live-capture data, lodge occupancy, and digitized pond layers to investigate how death and dispersal of individual beavers from a colony can affect occupancy or abandonment of dams and ponds used by colony members. We will also estimate population rates of mortality and dispersal to link to changes in pond formation rate and water storage capacity across the larger Greater Voyageurs Ecosystem.

Activity Milestones:

Description	Completion Date
Analyze factors affecting abandonment and establishment of beaver colonies	December 31, 2023
Final report and peer-reviewed publication submitted	June 30, 2024

Project Partners and Collaborators

Name	Organization	Role	Receiving Funds
Dr. Jake Ferguson	University of Hawaii	Assistance with study design, analysis, and writing.	No
Sean Johnson-Bice	University of Manitoba	Assistance with study design and writing.	No
Dr. Jerry Belant	Syracuse University of New York (SUNY)	Assistance with study design, analysis, and writing.	No
Dr. Seth Moore	Grand Portage Reservation Tribal Government	Assistance with study design and writing. Oversight of post-doctoral researcher.	Yes

Dissemination

Describe your plans for dissemination, presentation, documentation, or sharing of data, results, samples, physical collections, and other products and how they will follow ENRTF Acknowledgement Requirements and Guidelines.

Project progress and results will be shared with the public in a number of ways. While analyses are proceeding, outreach will include newsletter articles; articles in local, regional, and state newspapers; posts on Voyageurs National Park's Facebook page and Instagram page; presentations to interested stakeholder groups (e.g., Voyageurs National Park Association or International Joint Commission); presentations at scientific conferences; and peer-reviewed literature in quality journals. The Minnesota Environment and Natural Resources Trust Fund (ENRTF) will be acknowledged through use of the trust fund logo or attribution language on project print and electronic media, publications, signage, and other communications per the ENRTF Acknowledgement Guidelines.

Long-Term Implementation and Funding

Describe how the results will be implemented and how any ongoing effort will be funded. If not already addressed as part of the project, how will findings, results, and products developed be implemented after project completion? If additional work is needed, how will this be funded?

This project builds on an existing long-term database of beaver data unparalleled in North America, conservatively representing >\$2,000,000 in previous funding. This project also builds on the 2017 LCCMR project for Windels/Voyageurs National Park "Effects of Wolves on Beavers, Moose, and Deer in the Border Lakes Region." We will disseminate our information through peer-reviewed publications and reports, print/social media, and public presentations to ensure knowledge transfer.

Other ENRTF Appropriations Awarded in the Last Six Years

Name	Appropriation	Amount Awarded
Effects of Wolf Predation on Beaver, Moose, and Deer	M.L. 2017, Chp. 96, Sec. 2, Subd. 03l	\$293,000
Evaluate Control Methods for Invasive Hybrid Cattails	M.L. 2018, Chp. 214, Art. 4, Sec. 2, Subd. 06c	\$131,000

Difference between Proposal and Work Plan

Describe changes from Proposal to Work Plan Stage

Budget fixed to reflect \$168,000 recommended.

Changed project collaborators to reflect new collaborators.

Changed timelines and due dates to reflect new project start date and anticipated extra require to complete (from 2.5 to 3.0yrs).

Additional Acknowledgements and Conditions:

The following are acknowledgements and conditions beyond those already included in the above workplan:

Do you understand and acknowledge the ENRTF repayment requirements if the use of capital equipment changes?

N/A

Do you agree travel expenses must follow the "Commissioner's Plan" promulgated by the Commissioner of Management of Budget or, for University of Minnesota projects, the University of Minnesota plan?

Yes, I agree to the Commissioner's Plan.

Does your project have potential for royalties, copyrights, patents, or sale of products and assets?

No

Do you understand and acknowledge IP and revenue-return and sharing requirements in 116P.10?

N/A

Do you wish to request reinvestment of any revenues into your project instead of returning revenue to the ENRTF?

N/A

Does your project include original, hypothesis-driven research?

Yes

Does the organization have a fiscal agent for this project?

No

Do Beavers Buffer Against Droughts and Floods?

Steve Windels

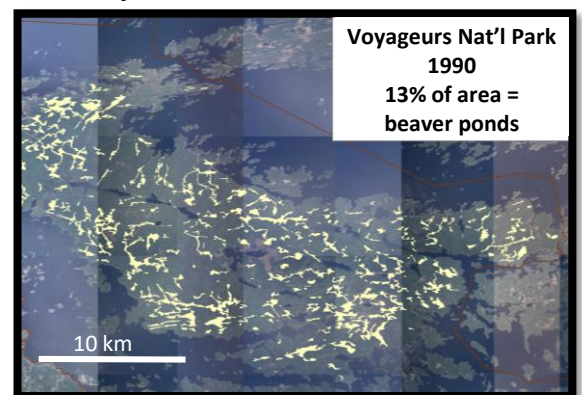

Minnesota's climate is changing. Precipitation events are becoming flashier and heavier; summer droughts more intense. How do we keep the "right" amount of water on the landscape?

Beavers are *ecosystem engineers*, creating ponds by damming small streams. Each individual pond can hold as much as 2 million gallons of water. They also provide habitat for many wetland wildlife species.

At larger scales, beavers can dramatically increase the water-storage capacity of the landscape in relatively short time frames!

BUT WE STILL DON'T UNDERSTAND WHY BEAVER POPULATIONS CHANGE, HOW POPULATION CHANGES ARE LINKED TO CLIMATE AND WEATHER EVENTS, AND WHAT THAT MEANS FOR WATER STORAGE!

Voyageurs National Park (VNP) is a *natural laboratory* to study beavers.

- Highest beaver densities recorded in the United States.
- Currently, VNP operates largest and longest-running beaver study in North America.
- Combines aerial surveys, live-capture data, and air photo interpretation to monitor beaver population dynamics and landscape change.

Expected Project Outcomes

- Link beaver population dynamics to changes in water storage capacity.
- Estimates of water storage of beaver ponds over time.
- Improved beaver management to meet local and regional planning needs.
