2022 Request for Proposal

General Information

Proposal ID: 2022-230

Proposal Title: Managing Highly Saline Waste From Municipal Water Treatment

Project Manager Information

Name: Natasha Wright Organization: U of MN - College of Science and Engineering Office Telephone: (612) 219-3540 Email: wrigh677@umn.edu

Project Basic Information

Project Summary: We aim to develop a cost- and energy-efficient method of managing concentrated saline waste from municipal desalination plants, increasing the economic feasibility of centralized water softening and sulfate removal.

Funds Requested: \$266,000

Proposed Project Completion: June 30 2025

LCCMR Funding Category: Water Resources (B)

Project Location

- What is the best scale for describing where your work will take place? Statewide
- What is the best scale to describe the area impacted by your work? Statewide
- When will the work impact occur?

During the Project and In the Future

Narrative

Describe the opportunity or problem your proposal seeks to address. Include any relevant background information.

Levels of chloride and sulfate (both salts) in Minnesota waterways is a growing concern due to the potential for harm to aquatic life (chloride) and the quality of water used for growing wild rice (sulfate). Increased chloride comes from multiple sources including salt used for winter road maintenance, residential and commercial water softeners, industry, and agriculture. Sulfate also has multiple sources to surface water, including industrial waste, domestic waste, and use of groundwater for agricultural, industrial, and domestic needs. Because WWTPs are not equipped with the technology to remove dissolved salts, chloride and sulfate that enter these facilities end up back in waterways.

An opportunity exists to reduce this discharge to waterways by installing centralized water softening and desalination technology (such as reverse osmosis, RO) at the municipal scale. Doing so, however, results in a liquid waste stream that contains all the removed contaminants in highly concentrated form; this waste stream has to be treated and properly disposed of, which is expensive. A recent ENTRF-funded report to analyze sulfate treatment options indicates that brine management would represent >46% of the total capital cost and >81% of the operational cost of a newly installed RO system at sample POTWs (MPCA, 2018).

What is your proposed solution to the problem or opportunity discussed above? i.e. What are you seeking funding to do? You will be asked to expand on this in Activities and Milestones.

While inland treatment plants using RO typically inject this concentrated waste into deep wells, evaporate the remaining water in large evaporation ponds, or use an evaporative crystallizer, none of these methods are viable for treatment plants in Minnesota. All three are far too expensive and standard evaporation ponds require too much land area, especially given the seasonal climate variation (temperature and humidity) in Minnesota.

One method that could be used to reduce the capital and energetic cost of brine management is convection enhanced evaporation (CEE). An example of CEE is Wind Aided Intensified eVaporation (WAIV), a system that utilizes hanging vertical sheets to increase the evaporative surface area for a given area of land (Gilron, 2003). Initial calculations show that CEE could reduce the land area required by at least 30 times versus standard evaporation ponds, while avoiding the high capital cost and fuel required for a crystallizer. However, a number of questions remain about the optimal physical design, ideal material properties for the evaporation surfaces, and how precipitated salts could be removed from the sheets. Our goal is to answer those questions – and in the future, be able to reuse the precipitated salts for practical purposes.

What are the specific project outcomes as they relate to the public purpose of protection, conservation, preservation, and enhancement of the state's natural resources?

The target project outcome of our research will be a cost- and energy-efficient system for managing the brine (concentrated salt-laden liquid waste) from membrane-based water treatment plants at the municipal scale. This will increase the economic feasibility of utilizing reverse osmosis for centralized water softening and treatment, thereby substantially reducing the addition of chloride, sulfate, and other contaminants to Minnesota waterways.

Activities and Milestones

Activity 1: Develop model for how the highly concentrated salt brine evaporates from various evaporation surfaces

Activity Budget: \$131,000

Activity Description:

Previous models from our team and models in the literature will be extended to include the evaporative behavior of highly concentrated industrial and desalination brines. This model will be validated using a lab-scale experimental setup in simulated conditions to quantify the predictive capability of the model. Modeling will include natural, forced, and mixed convection scenarios, vertical sheets and horizontal trays, and parallel flow, counter-flow, and co-flow arrangements.

Activity Milestones:

Description	Completion Date
1. Develop integrated model of CEE for vertical and horizontal surfaces in parallel flow	December 31 2022
2. Validate vertical surface, parallel flow model using in-lab prototype under simulated conditions	June 30 2023
3. Develop integrated model of CEE for counter-flow and co-flow arrangements.	December 31 2023

Activity 2: System optimization and MN-based piloting

Activity Budget: \$135,000

Activity Description:

Once we have a predictive model, we will analyze the parametric relationships between design variables (for example water composition, ambient temperature and humidity, surface tension, surface orientation, flow configuration). We will use this understanding to perform multi-objective design optimization, focused on reducing cost and energy consumption. A small pilot-system will be prototyped and tested under simulated conditions in the lab.

Activity Milestones:

Description	Completion Date
1. Understanding of parametric relationships between system variables	June 30 2024
2. Develop theory for an optimized system design	December 31 2024
3. Pilot system tested under simulated conditions and techno-economic assessment for a MN WWTP	June 30 2025
prepared.

Catherine	Minnesota	The MPCA continues to be interested in centralized water softening and	No
Neuschler	Pollution	treatment. Their staff will help us understand cost barriers and determine	
	Control	common operating points (flow rates, water quality parameters), enabling us to	
	Agency	optimize and provide case studies on benefits achieved through this technology.	

Long-Term Implementation and Funding

Describe how the results will be implemented and how any ongoing effort will be funded. If not already addressed as part of the project, how will findings, results, and products developed be implemented after project completion? If additional work is needed, how will this be funded?

We continue to pursue National-scale funding for this project. We have received funds through the Bureau of Reclamation to pilot an alpha prototype of the proposed system using horizontal evaporative surfaces in New Mexico. We also hope to work with a team at the Carlson School of Management to determine realistic value propositions for the technology as part of Activity 2, Outcome 3 (MN-based techno-economic assessment).

Project Manager and Organization Qualifications

Project Manager Name: Natasha Wright

Job Title: Assistant Professor

Provide description of the project manager's qualifications to manage the proposed project. Richard & Barbara Nelson Assistant Professor in the Department of Mechanical Engineering at the University of Minnesota – Twin Cities

B.S., Mechanical Engineering, 2012, University of St. Thomas, St. Paul, MN S.M., Mechanical Engineering, 2014, Massachusetts Institute of Technology, Cambridge, MA PhD, Mechanical Engineering, 2018, Massachusetts Institute of Technology, Cambridge, MA Post-Doctoral Associate, Environmental Engineering, 2019, University of Minnesota

Dr. Natasha Wright will be responsible for the overall project coordination. Her research focuses on the design of decentralized desalination (salt removal) systems, with a specialty in membrane-based separation processes and their pairing with renewable energy sources. Over the last 9 years, she has piloted combined energy generation / water treatment systems in the United States, India, and Gaza. Recent work has focused on reducing the cost of small-scale desalination systems via the redesign of system sub-components. This work has resulted in numerous design awards including Forbes 30 Under 30 and the Lemelson Prize at MIT, two patents, and several papers in the field of Desalination.

Organization: U of MN - College of Science and Engineering

Organization Description:

The University of Minnesota is one of the largest, most comprehensive, and most prestigious public universities in the United States (http://www1.umn.edu/twincities/01_about.php). The laboratories and offices of the PI contain all of the necessary fixed and moveable equipment and facilities needed for the proposed studies.

Administrative Use

Does your project include restoration or acquisition of land rights?

No

- Does your project have potential for royalties, copyrights, patents, or sale of products and assets? Yes
- Do you understand and acknowledge IP and revenue-return and sharing requirements in 116P.10? Yes
- Do you wish to request reinvestment of any revenues into your project instead of returning revenue to the ENRTF? No
- Does your project include original, hypothesis-driven research? Yes
- Does the organization have a fiscal agent for this project?

Yes, Sponsored Projects Administration
